One month.

Start Thursday 12 November 2026. Weekends are off. The build is planned to ship on 11 December. It can leave earlier. It may use five extra working days, and no more, for fixes only.

EARLY	TARGET	LATEST
4 Dec	**11 Dec**	**18 Dec**
If each block lands on its short side. About 17 working days.	The date to plan around. 12 December falls on a Saturday.	Target plus five working days. Reserve for fixes, not new scope.

01	**Foundation** Login, roles, case, subject. Masked SSN, DOB, aliases, addresses, employer, spouse.	3–5 DAYS
02	**Ingest** Many Word files and many spreadsheets. Errors visible. Source of every value kept.	4–6 DAYS
03	**Rules** Green, red, blue, violet. Same file and same rule version, same mark.	4–6 DAYS
04	**Review and Word** Confirm, reject, unresolved. Marked Word copy, summary, CSV.	4–6 DAYS
05	**Prove** Match one n8n example. Two users cannot open each other’s case.	2–5 DAYS

Short side ships early. The long side stops at 18 Dec.

Work starts Thursday 12 November. Each block has a short and a long duration. The short path adds up to about 17 working days and finishes on 4 December. The planned path finishes on 11 December. Only five working days sit after that. Those five are one shared reserve. They are not added again on every block.

WHEN	PLANNED WORK	DONE WHEN
12–17 Nov	Foundation. App runs, a case can be opened, a subject can be saved.	A second role cannot open that case.
18–24 Nov	Ingest. Dummy Word files and one Excel are in the repo by 17 November.	A bad file shows an error. The others still import.
25 Nov–1 Dec	Rules, with tests for partial SSN, name orders, DOB, and address.	Fixtures reproduce green, red, blue, and violet.
2–8 Dec	Review desk and the generated Word file. Original upload is not edited.	Summary counts match the decisions on screen.
9–11 Dec	Prove. Run the saved n8n example. Fix only what that run exposes.	Target ship, Friday 11 December.
14–18 Dec	Reserve. Use it only if a block ran long. No new screens, no new rules.	Latest ship, Friday 18 December.

When it finishes early

- Foundation in 3 days, ingest in 4.
- Rules pass on the first fixture set.
- Word highlights work on the sample layout.
- Ship moves toward Friday 4 December.

When the five days get used

- A Word layout in the dummy set needs another pass.
- An address comment or a color is wrong on the n8n file.
- Those days come out of 14–18 December.
- If the samples arrive after 17 November, waiting spends this reserve first.

ON 11 DECEMBER THE APP CAN DO THIS

An investigator opens a case, enters the subject, uploads several Word reports and spreadsheets, reads green, red, blue, and violet, confirms or rejects, and downloads a marked Word copy plus a CSV. Separate client organizations, loads past 10,000 rows, and scanned pages are outside this month.

The month is a Laravel 12 app.

Screens, permissions, files, and jobs live in one codebase. Vue draws the pages through Inertia. A Redis queue does the slow work. The matching rules are ordinary PHP classes: no HTTP call, no AI, no outside service that reads a document. Docker runs the same image on a private server or on a cloud Aretia has approved.

PIECE	LARAVEL CHOICE	WHAT IT IS FOR
Screens	Laravel 12, Inertia, Vue 3	Open a case, upload, review, download
Login	Sessions, MFA, spatie roles	Admin, investigator, reviewer
Data	PostgreSQL	Subjects, source rows, decisions, audit
Queue	Redis and Horizon	Parse, match, and write Word off the click
Word	PHPWord	Read the report. Write a marked copy, comments, summary
Sheets	Laravel Excel	XLSX and CSV in. CSV and XLSX out
Files	Private disk	Originals stay inside this deployment
Ship	Docker Compose	App, worker, PostgreSQL, Redis

FOLDER	OWNS IN THIS MONTH	STAYS OUT OF
`Identity`	Users, MFA, roles, case policy	File bytes
`Cases`	Status and organization_id	Running a match inside the web request
`Subjects`	Name, masked SSN, DOB, aliases, addresses, employer, relatives	An unmasked SSN
`Ingestion`	Word and spreadsheet jobs, field names, parties, errors	Dropping a failed file quietly
`Matching`	RuleSet v1, normalization, evidence, color	The network and any AI API
`Review`	Confirm, reject, unresolved, profile links	Deleting a source row
`Annotation`	Highlights, address comments, per-document summary	Editing the original upload
`Audit`	Who opened, exported, or decided	SSN digits in the log

Foundation, then the files.

12–17 NOV · 3 TO 5 DAYS

Login, case, subject

Laravel boots with session login and three roles. A case belongs to one organization. This month there is one organization, and the column is still there so a second client later does not force a rewrite. The subject form saves the masked SSN exactly as typed, plus date of birth, gender, age, aliases, known addresses, employer, and spouse or relative. A policy on the server checks every case. Hiding a button is not the check. An audit row records the open. It never stores the SSN.

LARAVEL PIECE	CREATED THIS WEEK
`Migrations`	users, organizations, cases, subjects, aliases, addresses, relatives
`Policy`	CasePolicy. A user outside the case gets nothing, including downloads
`Screens`	Inertia pages: sign in, case list, new case, subject form
`Docker`	app, queue worker, PostgreSQL, Redis. Same compose for the whole month

18–24 NOV · 4 TO 6 DAYS

Word and Excel become rows

One case accepts several DOCX files and several spreadsheets. Each file is stored on the private disk and gets a source_files row: queued, parsed, or failed. A queue job, IngestSourceFile, runs per file. Laravel Excel reads XLSX and CSV in chunks. A small field dictionary treats “mailing address”, “standard address”, and “address” as one column. PHPWord reads the report and keeps the role of each named party, so a name in the filing is not assumed to be the subject. Every extracted value keeps its file, sheet, and row. import_errors shows on the case. Retrying one file does not re-upload the others.

LARAVEL PIECE	CREATED THIS WEEK
`Jobs`	IngestSourceFile. Horizon shows the queue. The browser does not wait on the parse
`Tables`	source_files, source_records, record_parties, import_errors
`Packages`	maatwebsite/excel for sheets. phpoffice/phpword for the report

GATE FOR THIS BLOCK

Dummy Word files and one Excel need to be in the repo by 17 November. Without them the jobs can be written, and the field rules cannot be proven. Days spent waiting come out of 14–18 December.

The color is a PHP result.

25 NOV–1 DEC · 4 TO 6 DAYS

RuleSet v1

Matching sits in app/Domain/Matching and has no controller. A job calls it after ingest. It normalizes the six name orders, a year-only date against a month-and-year date, address parts, and the visible SSN digits. It looks up candidates by last name and the SSN prefix. It does not compare every row with every other row. Each field is stored as match, mismatch, or missing. A blank date is missing, never a mismatch. The rule version is saved on the result, so a re-run of the same version does not change the color. PHPUnit fixtures cover partial SSN, the name orders, date of birth, the common-name list, and the address lookup.

2–8 DEC · 4 TO 6 DAYS

Review desk and the Word copy

An Inertia table sorts green, then blue, violet, then red. The investigator confirms, rejects, or leaves the row unresolved. review_decisions stores the user, the time, and the reason. Two directory profiles can point at one subject. The link is a decision. The source rows stay. A second job writes a new DOCX with PHPWord: highlights, an Excel row pasted as a comment when the address misses, and a count at the end of each document. The upload on disk is not opened for writing. CSV and Excel exports read the same decisions, so the file and the screen agree.

9–11 DEC, RESERVE 14–18 DEC

Prove it on the n8n example

The saved n8n case runs through the queue. Colors that disagree with that example get fixed here, not with a new rule invented on the spot. A test user from outside the case cannot download the Word file. If this passes on 11 December, that is the ship. If a highlight or a comment is still wrong, 14–18 December is the only extra time, and it is for that fix.

COLOR	WHAT THE PHP RULE DOES
Green	Visible SSN matches, or name plus address matches. Confirm.
Red	One SSN digit differs, or the first or last name fails, or the birth month or year contradicts.
Blue	Full name with a middle matches. One more identifier is still required.
Violet	First and last only. Possible. Do not confirm.
